Reg. NO : 192473017

Experiment 4: Total Annual Sales and Percentage Increase

Aim:

To calculate the total sales for four quarters and determine the percentage increase from the first quarter to the fourth quarter using NumPy.

Algorithm:

1. Import NumPy.
2. Create an array containing sales for four quarters.
3. Calculate total annual sales using np.sum().
4. Calculate the percentage increase from Q1 to Q4.
5. Display the results.

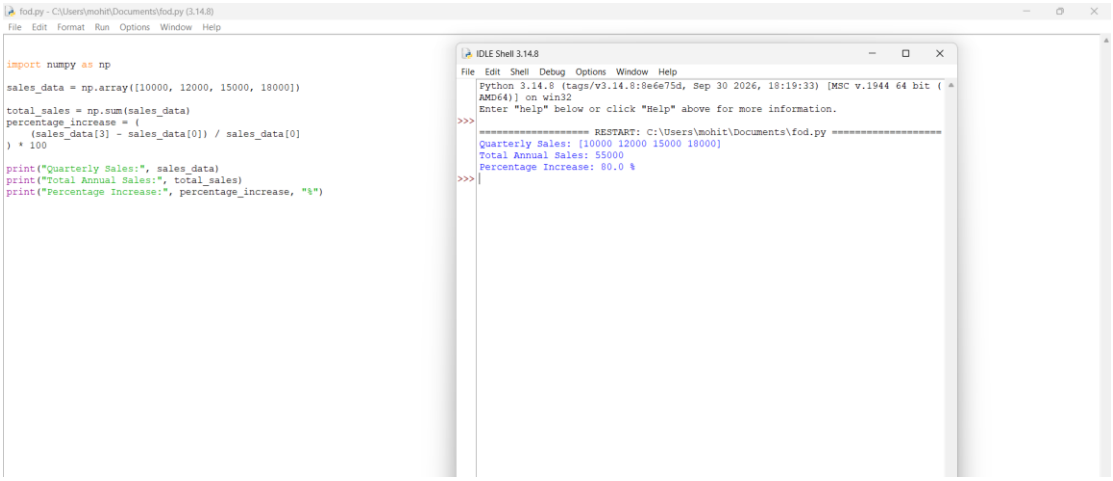

Python Code (IDLE):

```
import numpy as npsales_data = np.array([10000, 12000, 15000, 18000])
total_sales = np.sum(sales_data)
percentage_increase = (     (sales_data[3] - sales_data[0]) / sales_data[0])
* 100
print("Quarterly Sales:", sales_data)
print("Total Annual Sales:", total_sales)
print("Percentage Increase:", percentage_increase, "%")
```

Input:

Quarterly sales = [10000, 12000, 15000, 18000]

Output:

Result:

Thus, the total annual sales were calculated as 55,000, and sales increased by 80% from the first quarter to the fourth quarter.
